Fold completely the “barrel”
folds and the bottom folds.
They will not stay folded.
This is normal. The cup will
achieve its form after the
flaps are folded in.

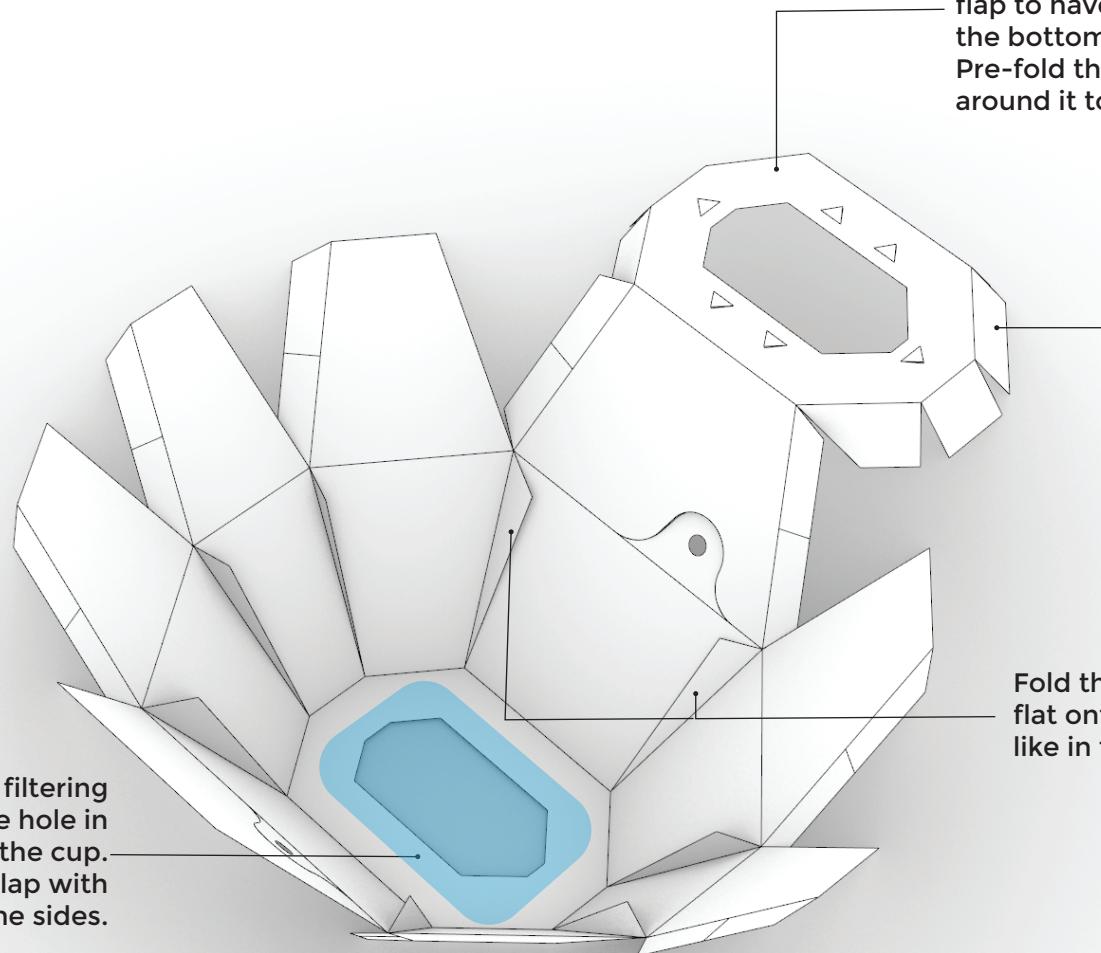

f8ld

github.com/andrei-nejur/f8ld

Add a patch of filtering material to cover the hole in the bottom of the cup.
Allow for some overlap with the sides.

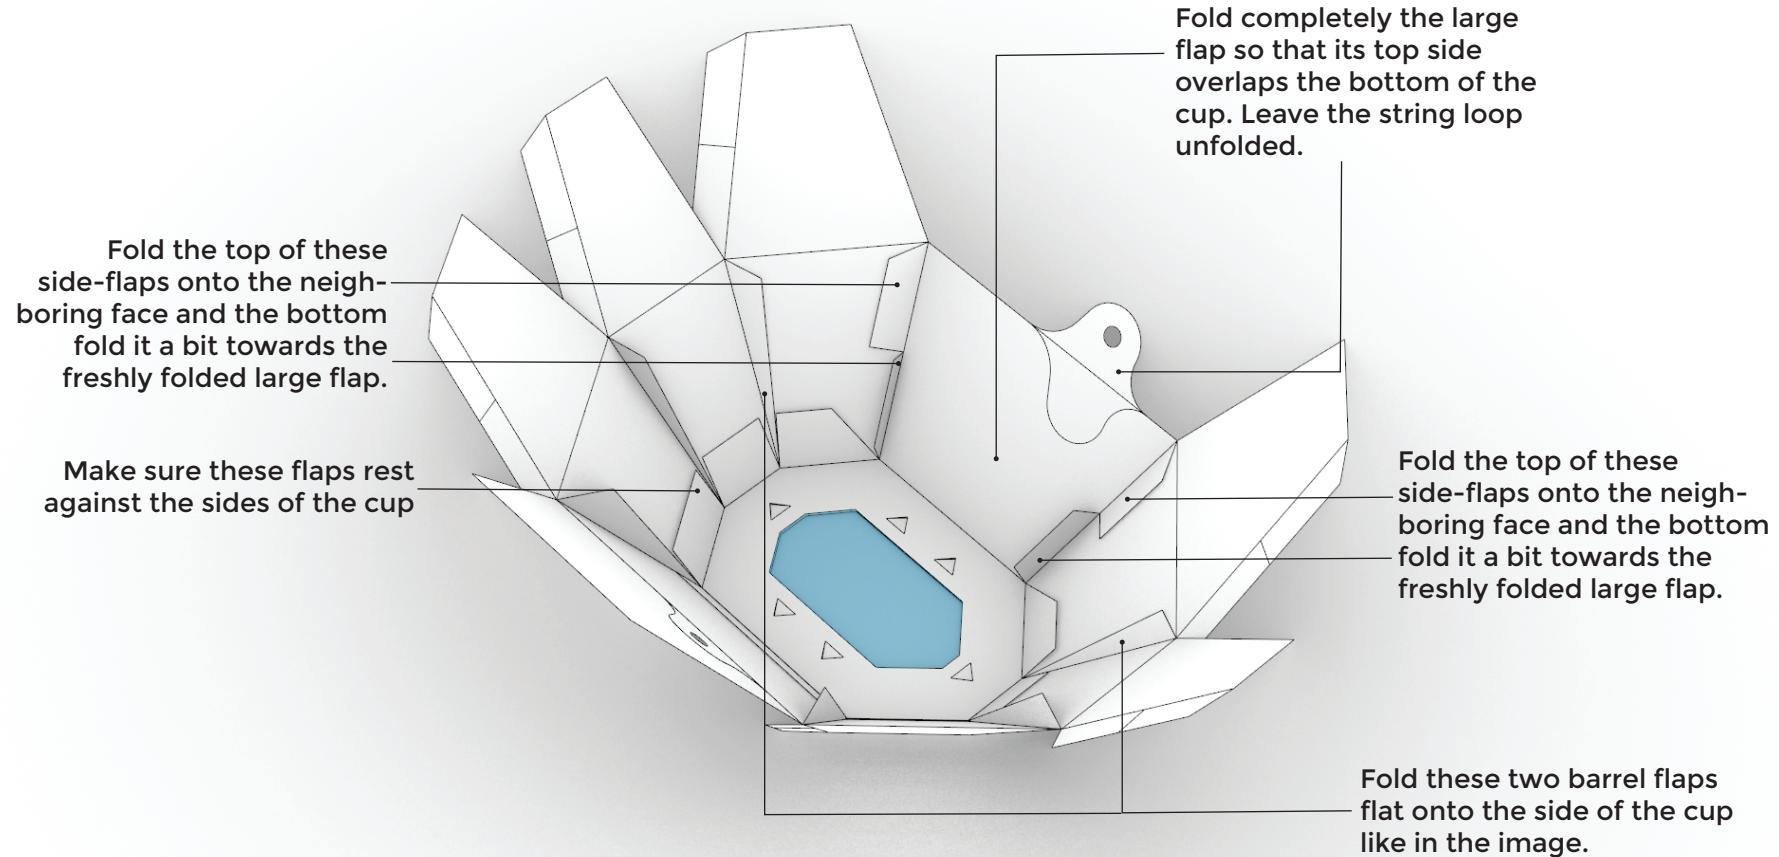

Pre-fold the top part of this flap to have it ready to meet the bottom of the cup.
Pre-fold the small flaps around it too.

Fold these two barrel flaps flat onto the side of the cup like in the image.

Fold the top of these side-flaps onto the neighboring face and the bottom fold it a bit towards the freshly folded large flap.

Fold the barrel flaps flat onto the side of the cup like in the image for the next big flaps too.

Continue the folding sequence with the neighboring flaps. Make sure the large flap covers the small flaps next to the bottom of the cup.

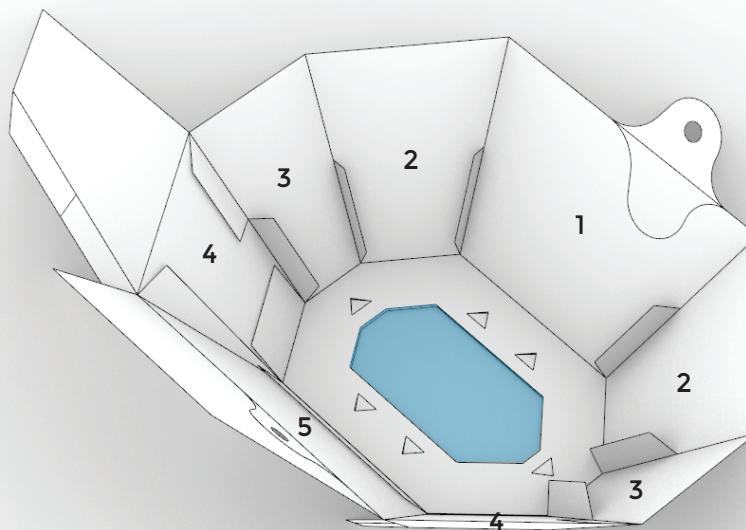

Leave the bottom of the split side-flaps out.

Fold in the same way for this flap like for the flap opposite.

Continue the folding sequence with the neighboring flaps. Use the same folding sequence like in the previous steps. 1 Fold in barrel flap; 2 Fold split flap: top in and bottom out; 3 Fold the large flap to cover them. Observe that the sequence of the large flap folds starts from the flap connected to the filter holding part and extends outwards around the perimeter until it reaches the large flap opposite to it.

Fold the last large flap in.
This flap should have no
“barrel” flaps to cover. Make
sure the side split flaps from
the previous folds are folded
in the correct position
Top in to be covered and
bottom out and a bit
towards the neighboring
flaps.

Do not fold the string loop.
